FORECASTING PRINCIPLES AND PRACTICE

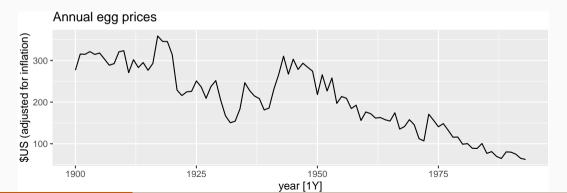

5. The forecaster's toolbox

5.6 Forecasting using transformationsOTexts.org/fpp3/

Modelling with transformations

```
eggs <- prices |>
  filter(!is.na(eggs)) |>
  select(eggs)
eggs |> autoplot() +
  labs(title = "Annual egg prices", y = "$US (adjusted for inflation)")
```

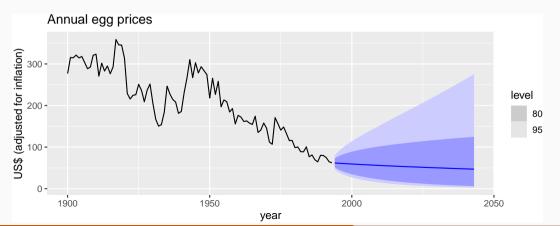

Modelling with transformations

Transformations used in the left of the formula will be automatically back-transformed. To model log-transformed egg prices, you could use:

Forecasting with transformations

```
fc <- fit |>
 forecast(h = 50)
fc
## # A fable: 50 x 4 [1Y]
## # Key: .model [1]
##
      .model
                              vear
                                               eggs .mean
   <chr>
                             <dbl>
##
                                           <dist> <dbl>
##
   1 RW(log(eggs) ~ drift()) 1994 t(N(4.1, 0.018))
                                                    61.8
   2 RW(log(eggs) ~ drift()) 1995 t(N(4.1, 0.036))
                                                     61.4
##
    3 RW(log(eggs) ~ drift()) 1996 t(N(4.1, 0.055))
                                                     61.0
##
   4 RW(log(eggs) ~ drift()) 1997 t(N(4.1, 0.074))
##
                                                     60.6
   5 RW(log(eggs) ~ drift()) 1998 t(N(4.1, 0.093))
                                                     60.2
##
   6 RW(log(eggs) ~ drift())
                              1999 t(N(4, 0.11))
##
                                                     59.8
   7 RW(log(eggs) ~ drift())
##
                              2000 t(N(4, 0.13))
                                                    59.4

```

Forecasting with transformations

- Back-transformed point forecasts are medians.
- Back-transformed PI have the correct coverage.

- Back-transformed point forecasts are medians.
- Back-transformed PI have the correct coverage.

Back-transformed means

Let X be have mean μ and variance σ^2 .

Let f(x) be back-transformation function, and Y = f(X).

Taylor series expansion about μ :

$$f(X) = f(\mu) + (X - \mu)f'(\mu) + \frac{1}{2}(X - \mu)^2 f''(\mu).$$

- Back-transformed point forecasts are medians.
- Back-transformed PI have the correct coverage.

Back-transformed means

Let X be have mean μ and variance σ^2 .

Let f(x) be back-transformation function, and Y = f(X).

Taylor series expansion about μ :

$$f(X) = f(\mu) + (X - \mu)f'(\mu) + \frac{1}{2}(X - \mu)^2 f''(\mu).$$

$$E[Y] = E[f(X)] = f(\mu) + \frac{1}{2}\sigma^2 f''(\mu)$$

Box-Cox back-transformation:

$$y_t = \begin{cases} \exp(w_t) & \lambda = 0; \\ (\lambda W_t + 1)^{1/\lambda} & \lambda \neq 0. \end{cases}$$

$$f(x) = \begin{cases} e^x & \lambda = 0; \\ (\lambda x + 1)^{1/\lambda} & \lambda \neq 0. \end{cases}$$

$$f''(x) = \begin{cases} e^x & \lambda = 0; \\ (1 - \lambda)(\lambda x + 1)^{1/\lambda - 2} & \lambda \neq 0. \end{cases}$$

Box-Cox back-transformation:

$$y_t = \begin{cases} \exp(w_t) & \lambda = 0; \\ (\lambda W_t + 1)^{1/\lambda} & \lambda \neq 0. \end{cases}$$

$$f(x) = \begin{cases} e^x & \lambda = 0; \\ (\lambda x + 1)^{1/\lambda} & \lambda \neq 0. \end{cases}$$

$$f''(x) = \begin{cases} e^x & \lambda = 0; \\ (1 - \lambda)(\lambda x + 1)^{1/\lambda - 2} & \lambda \neq 0. \end{cases}$$

$$\mathsf{E}[\mathsf{Y}] = \begin{cases} e^{\mu} \left[1 + \frac{\sigma^2}{2} \right] & \lambda = 0; \\ (\lambda \mu + 1)^{1/\lambda} \left[1 + \frac{\sigma^2 (1 - \lambda)}{2(\lambda \mu + 1)^2} \right] & \lambda \neq 0. \end{cases}$$
